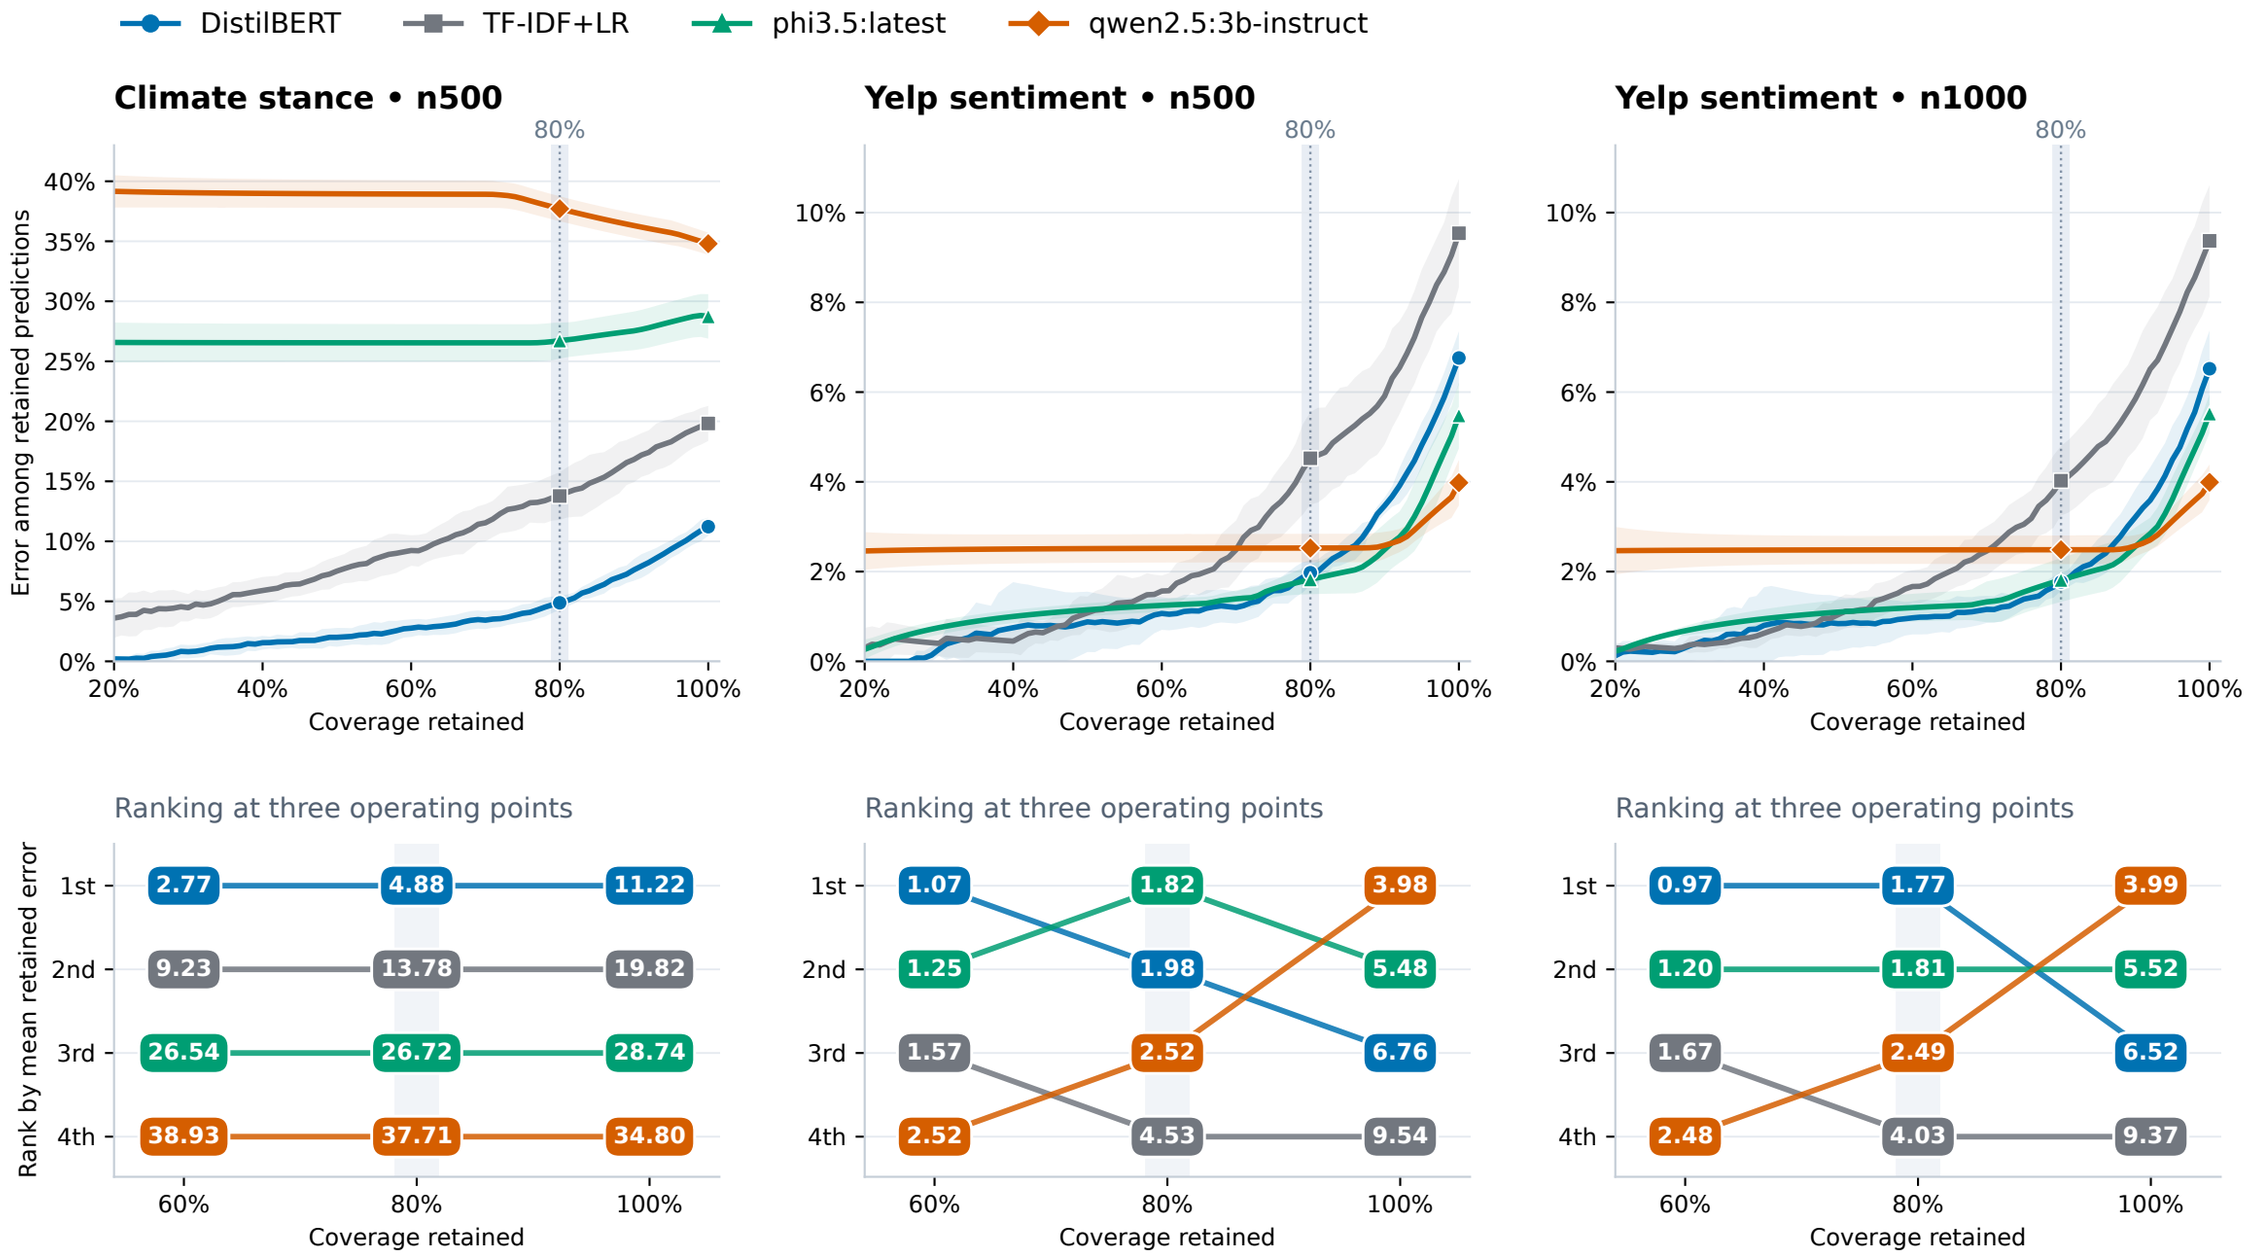
Coverage changes the model ranking

Within-period predictions • matched examples per setting • five sampling seeds • frozen models use P3



Top: mean risk with ±1 sample SD. Bottom: numbers inside markers are retained error percentages; ranks describe means only.

Coverage sweep: 20–100%. Tied confidence scores use expected risk under uniform random tie-breaking; P5 abstention is excluded.

n is examples per class. Each model may retain different cases. Small rank differences do not establish a statistically reliable ordering.
